

## COMPUTER SCIENCE RESEARCH SEMINAR

### VFresh: Fast and Live Replacement of Hypervisor

**Spoorti Doddamani, PhD Student**  
**Department of Computer Science, Binghamton University**

**Friday, March 29, 2019 at noon in room R15, Engineering Building**

**Abstract:** Hypervisors are increasingly complex and must be often updated for applying security patches, bug fixes, and feature upgrades. However, in a virtualized cloud infrastructure, updates to an operational hypervisor can be highly disruptive.

Before being updated, virtual machines (VMs) running on a hypervisor must be either migrated away or shut down, resulting in downtime, performance loss, and network overhead. We present a new technique, called VFresh, to transparently replace a hypervisor with a new updated instance without disrupting any running VMs. A thin shim layer, called the hyperplexor, performs live hypervisor replacement by remapping guest memory to a new updated hypervisor on the same machine. The hyperplexor leverages nested virtualization for hypervisor replacement while minimizing nesting overheads during normal execution. We present a prototype implementation of the hyperplexor on the KVM/QEMU platform that can perform live hypervisor replacement within 10ms.

**Bio:** Spoorti Doddamani is a Ph.D. candidate at Binghamton University advised by Dr. Kartik Gopalan. Her research focuses on operating systems and virtualization.

This event is funded by GSOCS, a subsidiary of GSO, using Student Activity Fee funds

**Refreshments will be provided!**
