STRUCTURE / DETAIL VIEWS:
When viewing tables within the query workspace, users can switch between 2 views to help in building their query. The first view (default) is the structure view. This view displays the field names within the table in list form. The second view, Detail view, in addition to displaying the field names, will also provide a snapshot of the information contained in the Operational Data Store (ODS) for each individual field name. Users are able to add items to the request and/or filter lines from either view.

1. Structure View
2. Detail View
